

Belarus in 2020 the implementation of the "Program for the development of state standards based on international and European standards in the field of establishing requirements for environmentally friendly packaging and testing methods" was launched.

Belarus in 2020 the implementation of the "Program for the development of state standards based on international and European standards in the field of establishing requirements for environmentally friendly packaging and testing methods" was launched.

Currently, 26 state standards have been developed that are identical to international ones, of which 8 have been put into effect since April 1, 2021.

18 standards will be introduced in May-September 2022. These include, for example, standards for reusable packaging for the transportation of products (cargo).

A standard has also been adopted for bags or liners made of paper used to collect household waste, taking into account the main groups of municipal waste and their further disposal method.

A number of standards establish the most important quality indicators and test methods for recycled plastics intended for use in the production of semi-finished products and/or finished products.

Standards have been approved to ensure that environmental aspects are taken into account when setting packaging requirements aimed at minimizing any adverse environmental impact.

Another 15 standards for glass packaging, paper bags, garbage bags are being developed, which is planned to be completed by September 2022.

You can familiarize yourself with and purchase the standards, as well as the regulations for packaging, in the standardization department of RUE "Polotsk CSMS"
